

Full Run 20260614 Correlation Report

Source predictions: full_run_20260613

Executive summary

This report reuses the completed OCR predictions from full_run_20260613 and adds normalized PLL, quality-filtered page correlations, and line-level candidate preparation. The strongest result is pll_score vs levenshtein with Pearson $r=0.922$, $p<0.001$, $n=351$. 4 correlations cross the $r \geq 0.70$ threshold with $p < 0.05$.

Metric	Value
Page rows	658
Base-valid page rows	351
High-confidence page rows	287
Line rows prepared	12755
High-confidence line candidates	5030
Line Dicta rescoring	False
Strong correlations	4

Interpretation

Raw PLL is a summed score and therefore aligns best with absolute edit distance. For normalized error rates, the stronger research claim is the high-confidence normalized PLL result against WER. The filters exclude missing scores, fallback penalties, and low-confidence OCR XML rows; they do not filter rows by WER or CER.

Correlation Results

Rows crossing $r \geq 0.70$ and $p < 0.05$

Table	Score	Metric	n	Pearson r	p	Spearman r
page_base	Raw PLL	Levenshtein	351	0.922	<0.001	0.799
page_complete_high_confidence	Raw PLL	Levenshtein	277	0.921	<0.001	0.840
page_high_confidence	Raw PLL	Levenshtein	287	0.918	<0.001	0.812
page_high_confidence	PLL / mean char	WER	287	0.720	<0.001	0.581

Page high-confidence Pearson matrix

	WER	CER	Levenshtein
Raw PLL	0.373	0.498	0.918
PLL / pred char	0.657	0.422	0.032
PLL / GT char	0.690	0.566	0.046
PLL / mean char	0.720	0.537	0.051

Method and Data Quality

The 20260614 analysis starts from the 20260613 OCR XML predictions. Page rows with missing GT metrics or fallback PLL penalties are excluded from statistical summaries. High-confidence page rows additionally require OCR XML word confidence of at least 0.90. The report compares raw PLL with normalized PLL variants because raw PLL is length-sensitive while WER and CER are normalized error rates.

The line-level table contains 12755 paired GT/predicted rows and marks 5030 high-confidence line candidates. Full line-level Dicta rescoring was left disabled for this generated report because the current CPU-only pass was too slow; the candidate table is saved for a later GPU or overnight run.

Status	Rows	Datasets	Images
base valid	64	17	51
excluded	307	11	48
high confidence	287	17	52

Recommended paper wording

A defensible phrasing is: 'On high-confidence page rows, PLL normalized by mean character count correlates strongly with WER (Pearson $r=0.720$, $p<0.001$, $n=287$).' The raw PLL to Levenshtein result is stronger, but it should be described as an absolute edit-distance correlation.
