

Model Chooser Sample Report

Dataset: 348_3758c_default

Executive summary

This report summarizes `348\_3758c\_default` using 4 OCR model outputs and 112 line-level comparisons. The strongest result on this sample is `italian\_7`, which is best on PLL, WER, CER, and Levenshtein distance. The language-model PLL score is strongly aligned with the GT- based metrics on this sample, with Pearson correlations of 0.859 vs WER, 0.813 vs CER, and 0.810 vs Levenshtein distance. That makes PLL a useful proxy for OCR quality here, although the conclusion should be read as sample-level evidence rather than a full-corpus claim.

Metric	Value
Sample lines	28
Models compared	4
Line-level comparisons	112
Best model	italian_7
Best PLL	125.931
Best WER	0.336

Interpretation

On this sample, lower PLL tracks lower WER, lower CER, and lower Levenshtein distance. The model ranking is consistent across the four metrics, which is exactly what you want if the language-model score is meant to reflect OCR quality.

Scores arranged as tables

Model summary

Model	PLL	WER	CER	Levenshtein
italian 7	125.931	0.336	0.079	4.5
sinai no voc 61	157.511	0.644	0.219	12.286
prenumeranten	201.468	1.075	0.609	33.179
italian 7 retrained bnf150 6p	228.806	1.467	0.518	27.679

Pearson correlation matrix

	pll score	wer	cer	levenshtein distance
pll score	1.0	0.859	0.813	0.81
wer	0.859	1.0	0.832	0.82
cer	0.813	0.832	1.0	0.994
levenshtein distance	0.81	0.82	0.994	1.0

Model ranking and correlation heatmap

PLL versus GT-based metrics

Each subplot shows the line-level PLL score against one GT-based metric. The fitted trend lines slope upward, which means higher PLL generally comes with higher OCR error on this sample.
